CS-3009 - Deliverable # 02
Faculty Feedback and Evaluation System

Muhammad Qasim (23I-0552)
Zia Ul Baqa (23I-0606)
Mubashir Islam (23I-0834)

Sprint 02 - Overview

1. **Duration:** 1 Week
2. **Sprint Goal:** To add course-based constraints and finalize the admin panel. Write core features for the student-panel, such as viewing available instructors.
3. **Modules Developed:**
    a. Database schema refinement
    b. Course management module (add, view, delete)
    c. Student enrollment into a course.
    d. Faculty course assignment.
    e. Student panel with list of available teachers.
    f. Student forms for feedback.
    g. Rating system for the faculty (UI only)

Sprint 02 - Backlog

a) User Stories

- As an admin, I want to assign faculty to courses so that feedback is registered for students studying from the same instructor.
- As an admin, I want to enroll students in courses so that they can view and provide feedback for their relevant instructor.
- As a student, I want to submit feedback only for enrolled courses so that my feedback is valid.
- As a system, I want to enforce course-based constraints so that feedback is only registered for students taking the course.
- As a student, I want to access the student panel so that I can interact with the system.

b) Sub-user Stories and Task Breakdown

User Story: Assign faculty to courses

- Design faculty-course relationship in DB
- Create table for course assignments
- Implement UI for assigning faculty
- Validate assignment input
- List the added faculty

User Story: Enroll students in courses

- Design student-course relationship
- Create enrollment table
- Implement enrollment functionality
- Add validation checks
- List all enrolled students

User Story: Submit feedback with constraints

- Modify feedback table to include course_id
- Add constraint checks (enrollment validation)
- Update backend logic
- Test valid/invalid cases

User Story: Student panel

- Design basic UI layout
- Design feedback forms.
- Link to session manager at the backend.

Structured Specifications

User Story 1: Assign Faculty to Courses

Inputs	faculty_id, course_id
Outputs	confirmation of assignment
Processing	1. Validate faculty and course existence 2. Insert record into faculty-course mapping table
Preconditions	Faculty and course must already exist
Postconditions	Faculty is successfully assigned to the course
Exceptions	1. Invalid faculty/course ID 2. Duplicate assignment

User Story 2: Enroll Students in Courses

Inputs	student_id, course_id
Outputs	enrollment confirmation
Processing	1. Validate student and course existence. 2. Insert into enrollment table
Preconditions	Student and course must exist
Postconditions	Student is enrolled in the course
Exceptions	1. Invalid IDs 2. Duplicate enrollment

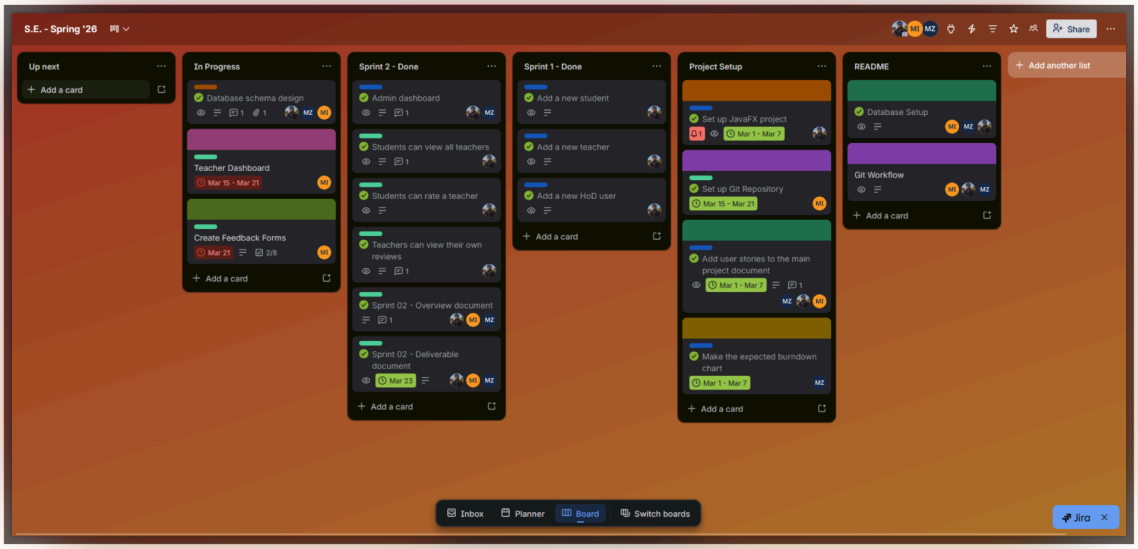
User Story 3: Submit Feedback with Constraints

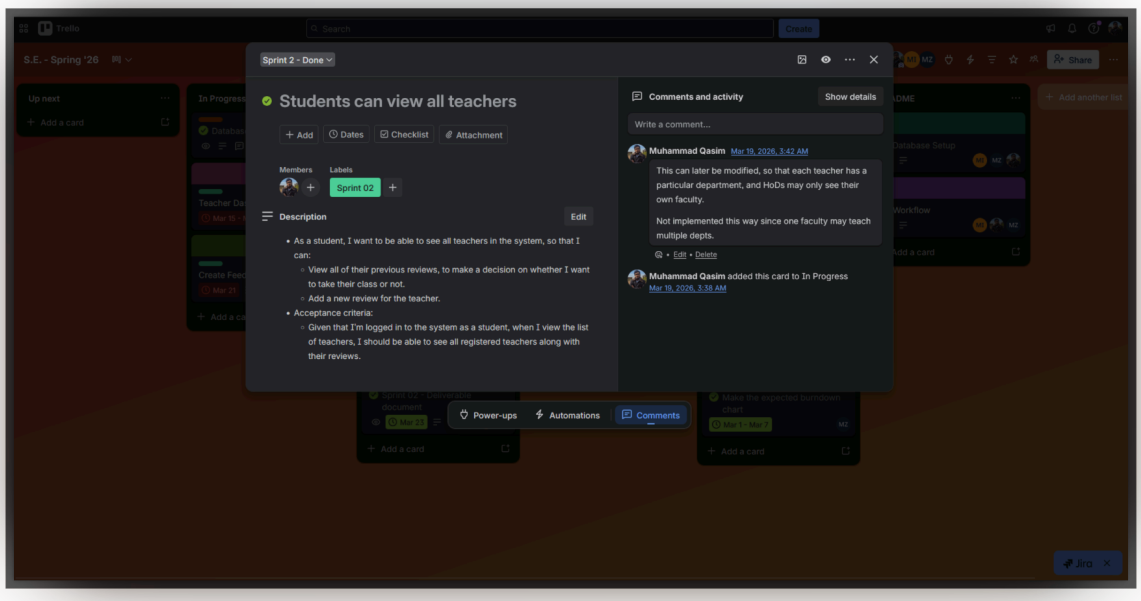
Inputs	student_id, teacher_id, course_id, rating, comment
Outputs	feedback submission confirmation
Processing	1. Check if student is enrolled in the course 2. Validate rating range 3. Insert feedback into database
Preconditions	Student must be enrolled in the course
Postconditions	Feedback is stored successfully
Exceptions	1. Student not enrolled 2. Invalid rating 3. Missing data

User Story 4: Access Student Panel

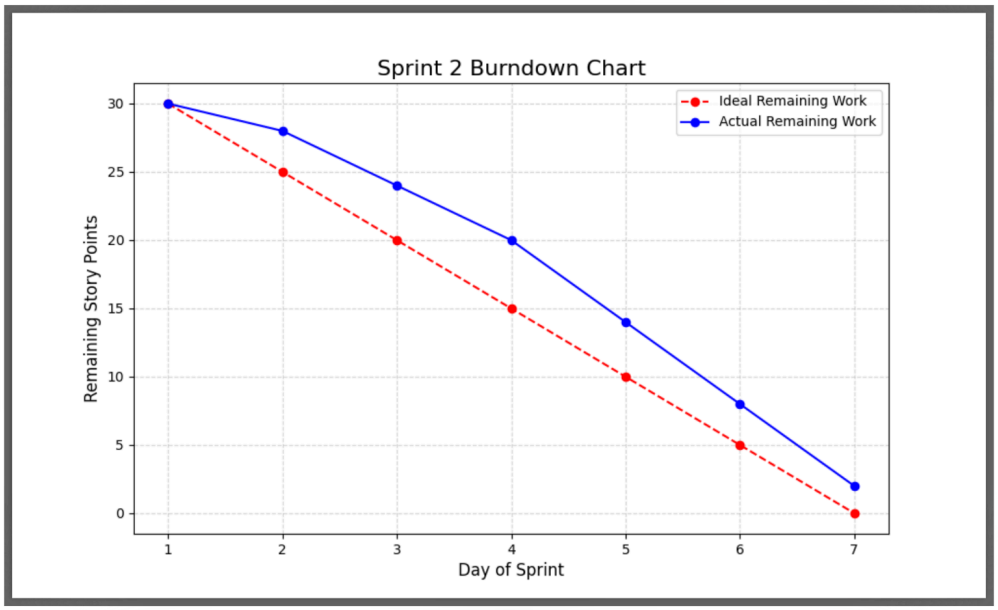
Inputs	student login credentials
Outputs	student dashboard interface
Processing	1. Authenticate user 2. Fetch relevant student data 3. Display UI components
Preconditions	Student must be registered
Postconditions	Student gains access to dashboard
Exceptions	1. Invalid login credentials 2. Data retrieval failure

Trello Scrum Board





Burndown Chart



The burndown chart shows slow progress relative to the projects due to several different reasons:

1. This sprint exclusively focused on two-person development, with communication gaps because of days-off.
2. The initial features took a lot of time in code, which is why you see the gap widen during the middle of the sprint.
3. As the development team starts to become comfortable with understanding the semantics and syntax of writing JavaFX, the gap starts to shrink.
